An investment providing a lifetime of **savings**

Danfoss solutions provide
a lifetime of savings

Driven by the global need to reduce CO₂ emissions, new legislations around the world are demanding air conditioning systems with higher energy performance as well as non-ODP⁽¹⁾ and lower-GWP⁽²⁾ refrigerants. These legislations affect all unit types and lead to the redesign a large number of HVAC ranges.

As well as conforming to strict new standards, next-generation systems need to meet the challenges of complex applications, increased energy efficiency and varied climates, while also providing flexibility and top comfort. As a result, the HVACR industry is facing increasing complexity and multiple challenges in terms of development, running and maintenance costs.

(1) ODP: Ozone Depletion Potential

(2) GWP: Global Warming Potential

Save on

A global overview of CO₂ emissions and regulations impacting HVAC markets

A revolution in the A/C market ...

Increasing population, level of comfort and high penetration of IT technologies are putting strong pressure on electric grids and driving up overall energy consumption

The increased demand for air conditioning systems and improved comfort is being driven by several factors. Examples include modern office architecture with large windows, as well as new development or renovation of hospitals, hotels, museums or data centers where air conditioning is critical.

New technologies spur the growth of multiple innovative applications, changing the way we live, communicate, conduct business and interact with machines. But new

technologies require more energy. This explosive combination is driving up energy demand and utility peak loads.

Strong pressure to reduce CO₂ emissions

The growing need to reduce CO₂ emissions and save energy has led governments to implement regulations to protect the environment and encourage the development of energy efficient solutions.

... opens up new opportunities

A few years ago, 60-80% of air conditioning systems (chillers, rooftops, etc.) did not comply with the new standards and needed to be redesigned⁽³⁾. Original Equipment Manufacturers are increasingly being challenged. OEMs

need to provide integrated solutions with superior reliability and efficiency that are easy to install and maintain. All this calls for new thinking and a new set of technologies.

Danfoss innovations support OEMs in the challenge of improving part-load efficiency and maintaining full-load performance while transitioning to low-GWP alternatives and keeping development costs at competitive levels. Our technologies provide OEMs and end-users alike with a lifetime of savings.

(3) Source Danfoss – Simulation based on Eurovent database and European draft for Ecodesign ENTR LOT 21 Tier2 level in 2014.

Danfoss compressors for air conditioning – a lifetime of savings

To meet the needs of an increasingly complex HVAC market, our extensive range of compressors offer functional benefits and savings throughout the lifecycle of the system from development and operating costs to servicing and maintenance.

Development costs

The flexibility, optimization and efficiency of Danfoss compressors ensure competitive design costs and short development times

Running costs

Danfoss technologies offer the widest portfolio for superior full and part-load efficiencies to reduce the running costs of the system

Service costs

The reliability, design and long working life of Danfoss compressors minimize maintenance and servicing costs while eliminating unplanned downtime

Savings on development costs

Commercial and office buildings, hotels, shopping malls, airports, hospitals, data centers, schools, museums... Every type of building, occupancy, comfort requirements and climate, place different demands on HVAC system design and technological options.

Whatever the target application or industry, Danfoss provides OEMs flexible and competitive design solutions for commercial rooftops, chillers, close controls, heat pumps and process chillers with shorter time to market and competitive applied costs.

Manifold configurations enable competitive design costs and staged modulation

Several compressors can be installed in a single system to provide flexible modulated cooling capacity. This approach extends capacity and performance while maintaining design and applied costs at competitive levels.

Manifold configurations allow a wide system line up with few compressor models. Manifolding also offers a lower sound level compared to alternative technologies.

Our expertise in manifold design enables Danfoss to provide a wide range of potential configurations, from 5 to 150TR in a single circuit. Danfoss goes through a full set of lab qualification tests in order to provide reliable solutions for piping strength, oil balancing, sound and vibrations.

Applying **variable speed** technology keeps getting easier

Variable speed technology offers flexible design possibilities with a wide range of cooling capacities to match different applications and needs. It offers savings in reduced inventory and complexity. In addition, some system components are not always longer needed, including soft starter, phase protectors, etc., and water buffer tanks have been either reduced or eliminated – all of which helps to ensure the competitiveness of development costs.

Danfoss inverter scrolls VZH – 3rd generation with IDVs

3rd generation of Danfoss inverter scrolls have been optimized for part-load operations to deliver a high level of efficiency across a wide range of applications. The prequalified compressor and drive packages reduce development time while increasing reliability. The Danfoss inverter scroll VZH with IDVs ranges from 4 to 26TR (52TR when used in hybrid tandems@ full speed) in one circuit. The 3rd generation of inverter scrolls VZH features extended operating map to fit more applications especially Close Control / CRAC units. It is the widest variable speed scroll lineup available in the world commercial HVAC market today.

IDV technology

Intermediate Discharge Valves (IDVs) are mechanical valves that improve the part-load efficiency of air conditioning systems.

Danfoss patented IDVs are being integrated into the 7.5 to 50 ton range of the Danfoss DSH scrolls, in the DSF scrolls and in the VZH inverter scrolls. The Danfoss DSH and VZH scroll ranges with IDVs are **backward compatible** with existing Danfoss scrolls to reduce complexity and minimize any need for redesign and qualification.

Danfoss Turbocor® compressors

Danfoss Turbocor® compressors have transformed the commercial HVAC market with innovative technology that redefines lifetime operating costs for chiller applications. Danfoss Turbocor®'s family of centrifugal compressors is the world's first range of totally oil-free compressors. They feature innovative yet proven technologies including magnetic bearings, variable-speed centrifugal compression and digital controls.

All Danfoss Turbocor® TTS and TGS have the same physical size and connection locations. They also use the same controls and monitoring interface module and standard mounts. Their extremely compact size and low weight allows OEMs and contractors to cost-effectively install the compressor with a much smaller footprint than conventional compressors. Exceptional low-noise operation with no vibration eliminates the need for additional noise protection.

Savings on running costs with the widest portfolio for superior part-load efficiency

Reduce CO₂ emissions and energy consumption to get to the energy efficiency standards:
Danfoss provides three options to help OEM customers meet the challenge

Manifold compressors

Enhancing part-load efficiency with staged modulation

The number of compressors running at any one time can be adapted to building occupancy and demand levels. This improves cooling efficiency and reduces energy use. Energy

performance is further enhanced with Danfoss IDV technology. In other terms, the benefits for the running costs of this type of system include:

- Up to 12 steps of capacity modulation for precise load-matching capabilities (trio in 4 circuits)
- high part-load / seasonal efficiency

Our even and uneven manifold configurations up to 150TR in one circuit offer wide staged capacity modulation. For example, a system

with six manifold compressors in two circuits offers capacity modulation from 17% to 100%. This enables higher part-load efficiency compared to screw technology in a system of equivalent capacity. Danfoss IDV technology, implemented in the 7.5-50 ton range of the fixed-speed Danfoss Scrolls DSH/DSF and Danfoss inverter Scrolls, further enhances energy efficiency under part load conditions.

Superior part-load efficiency with Danfoss IDVs

A/W Chillers with 2 trio circuits 3x25TR

Reduced yearly power demand (kWh)

➤ Low Pressure Ratio, part-load, discharge pressure is low, IDVs open

➤ High Pressure Ratio, full load and heating mode, discharge pressure is high, IDVs close

Danfoss IDVs

Danfoss Intermediate Discharge Valves (IDVs) mechanically reduce excessive compression of refrigerant under part-load conditions while maintaining the same cooling capacity. They adapt the effort of the motor to the pressure conditions in the system by opening when the pressure ratio (part-load) fall

below the built-in optimization point of the scroll. This reduces the effort of the motor and its electrical consumption thus improving the system's seasonal energy efficiency. IDV technology enhances system efficiency by 10-12% on average in Water-to-Water chillers and by 8-10% in rooftops and 6-8% in Air-to-Water chillers.

Less CO₂ emissions

Savings on running costs

Variable speed technology

Continuously matches cooling needs with high efficiency

Variable speed technology is the premium solution in commercial air conditioning when it comes to energy savings, optimal comfort, accurate humidity and temperature control and controlled impact on the electrical network.

Around 85% of traditional commercial air conditioning installations are oversized to enable them to handle peak load conditions (about 3% of the operating time). Variable speed technology continuously matches building cooling demand under part-load conditions which is the vast majority of operating time. It also handles peak load conditions in a cost effective way. With a very low starting current and the ability to manage power fluctuations, Danfoss variable speed solutions ease the strain on power grids.

Danfoss is a world leader in this segment and offers the widest available range of commercial scroll, reciprocating and oil-free centrifugal inverter compressors for systems from 3 to 350 tons in single compressor/circuit configurations. Capacities of over 1,000 tons can be achieved by using multiple compressors and circuits.

Danfoss Inverter Scrolls VZH – 3rd generation with IDVs

3rd generation Danfoss inverter scrolls feature an Interior Permanent Magnet (IPM) and dedicated variable speed drive designed to provide maximum efficiency across the full operating range. Adapting to varying pressure ratios, it delivers the highest level of efficiency across a wide range of applications. Numerous case studies in renovation projects and laboratory testing demonstrate energy savings of up to 35%.

Savings with Danfoss Turbocor® compressors TT

200 TR (700 kW) Air-cooled Chiller

Danfoss Turbocor® oil-free centrifugal technology

The Turbocor® family of compressors delivers outstanding energy efficiency in full- and part-load operation with energy savings of more than 42% compared to traditional compressors. The outstanding integrated part-load efficiency is the result of optimum energy performance through the entire operating range from 100% to ~20%.

The Danfoss Turbocor® compressor uses an integrated variable frequency drive to reduce compressor speed and maximize energy cost savings as the condensing temperature and/or heat load decreases. The soft start module, which is standard on every Danfoss Turbocor® compressor, significantly reduces the in-rush current at start up, provides advantages to line power systems and reduces thermal stress on the stator.

Savings on service and maintenance costs

HVAC units often operate under harsh conditions that can affect the lifetime and reliability of the unit itself: Frequent on/off cycling, high ambient start-up, defrost mode, low superheat conditions, high ambient operations, oil equalization and oil return at part-load operations can all have severe effects on the entire lifetime and compressor applications.

Danfoss scrolls DSH and DSF: a proven level of compressor robustness and system reliability

Danfoss has over 15 years of experience in R410A scroll compressors and billions of compressor operating hours in chiller applications worldwide. Building on this knowledge, Danfoss reliability and R&D teams use advanced statistical tools and psychrometric laboratory tests to study and measure the implications of system operations in critical conditions on compressor reliability. This has enabled Danfoss to develop the necessary countermeasures to improve compressor durability in many different applications. The generation of DSH and DSF Danfoss scrolls include several innovative features to improve compressor and system robustness.

1. Intermediate Discharge Valves:

Reduce the load on mechanical parts at start up, provide safer operation at high condensing and evaporating temperatures and contribute to better liquid management

2. Surface coating on thrust bearing and polymer bearings:

Improves compressor robustness in low lubrication conditions (start-up)

3. Organ pipe:

Maintains safe oil level at part-load in manifold configurations

4. Integrated Non-Return Valve:

Reduces refrigerant migration from high-pressure to low-pressure side after compressor shutdown

For DSH and DSF Large 20 to 50TR (240 to 600):

5. Integrated discharge temperature protection:

Prevents operation outside the operating envelope

6. Modified gas flow path (Snorkel) and sealed lower bearing:

Improves flooded start capabilities and overall compressor robustness against liquid slugs

Additional Reverse Vent Valve on DSH 090 to DSH 184 and DSF prevent from reversed rotation in case of wrong phase connection

Extended equipment life and minimal scheduled maintenance with oil-free Danfoss Turbocor® compressors

Reduced maintenance and mechanical complexity are primarily driven by the elimination of oil from the refrigerant circuit. Friction-free magnetic bearing technology eliminates the cost of oil-related equipment and management hardware as well as the maintenance costs associated with oil service.

This helps maintain long-term heat exchanger performance and delivers outstanding sustainability and long service life. Onboard intelligent electronic controls enable effective monitoring, control and self-diagnosis/correction of system operation. This eliminates some traditional OEM control and power panel costs and creates a sustainable, energy-efficient solution.

1. Motor and bearing control

Onboard digital electronics monitor compressor operation for optimization, reliability and diagnosis.

2. Permanent magnet motor

High-speed permanent magnet motor provides outstanding full-load efficiency.

3. Soft-Starter

The built-in soft-starter significantly reduces high in-rush current at start up to only 2 amps and is maintenance free.

4. Pressure and temperature sensors

Feed information back to the controller to ensure the compressor operates within its designed envelope at all times.

5. Magnetic levitation

Totally oil-free design eliminates performance degradation and maintenance of oil-related equipment.

6. Fast Re-Start

The compressor can be configured to restart in less than 30 seconds following a power outage without the need for a UPS which allows the Chiller to resume operation quickly.

RATING CONDITIONS:

(1) **Part load:** Evaporating Temp 7.2°C; Condensing Temp 35°C; Superheat 11.1K; Subcooling 8.3K

(2) **ARI:** Evaporating Temp 7.2°C; Condensing Temp 54.4°C; Superheat 11.1K; Subcooling 8.3K

(3) **EN12900:** Evaporating Temp 5°C; Condensing Temp 50°C; Superheat 10K; Subcooling 0K

(4) **Heating mode:** Evaporating Temp -7°C; Condensing Temp 50°C; Superheat 5K; Subcooling 5K.

All data include drive losses.

* map control, oil management and CDS drive control of VZH inverter scroll compressors and the Modbus master and Heat-sink Control of the CDS drive.

NOTES:

All data are for 380-480V
Also available for 200-240V

Danfoss Turbocor® Compressors TTS, VTT, TGS, TTH and TGH series

R134a
R513A

TTH325
95-115 TR
316-400
kW

The TTH oil-free, magnetic bearing compressors are optimized for higher lift operations such as air cooled chillers in hot ambient climates, heat pumps, heat recovery, thermal storage and low temp process applications.

TTS700
130-200 TR
460-700kW

TTS400
90-150 TR
315-525kW

TTS350
70-120 TR
250-420kW

TTS300
60-90 TR
210-315kW

VTT1200
Up to
400 TR / 1430kW

The VTT series expands Danfoss Turbocor® range of oil-free magnetic bearing compressors with a capacity range up to 400 TR / 1430 kW. This new range introduces IntraFlow® technology which increases the stable operating envelope to deliver best-in-class full and part-load efficiencies.

Cooling capacity in kW

in Tons																

R1234ze
R515B

TGH250
75-90 TR
247-300
kW

The TGH oil-free, magnetic bearing compressors are optimized for higher lift operations such as air cooled chillers in hot ambient climates, heat pumps, heat recovery, thermal storage and low temp process applications.

TGS520
90-150 TR
315-525kW

TGS490
85-140 TR
300-490kW

TGS390
70-120 TR
250-420kW

TGS310
60-90 TR
210-315kW

TGS230
40-70 TR
140-245kW

TGS490:

World's first oil free compressor optimized for use with low GWP refrigerants HFO1234ze and R515B.
