

FIREFLY®

Certified CPD Seminar Passive Fire Protection – Flexible Fire Barriers

Passive Fire Protection (PFP) is a critical component of fire safety within the widest array of buildings – from social housing to hospitals, retail units to vast warehouses.

This certified CPD explains the utilisation of PFP in the compartmentation of large voids and roof spaces as part of the fire safety strategy within a building.

As the manufacturer of FIREFLY™ flexible barriers, we have vast experience and expertise built on client engagement and site visits across all building types and the full breadth of site challenges. The CPD covers all material options, with a focus on flexible fire barriers and is specifically grounded in the reality of detailing, installation, and case studies to convey how to meet legal requirements and project specific fire safety objectives.

The Passive Fire Barriers seminar is delivered by experienced staff who provide technical advice and site support every day –

- Fire behaviour, legal requirements and fire standards
- Passive fire barrier material options
- Flexible fire barriers
- Detailing, Drawings & Installation methods
- Case studies
- Fire safety compliance questions you need to be 100% satisfied with

The seminar lasts around 45 minutes and we actively encourage questions during and after, often prompted by the case studies and detail drawings we share.
