PAROC® Delign is a comprehensive integrated facade system. The concept comprises panels, fixings, seals and flashings. The most visible part of the system is played by the PAROC Shadow sandwich panels with a stone-wool core and a steel surface forming a deep panel seam. Panels used in facades are generally between 120 and 300 mm thick.

However, the most remarkable innovation in the **Delign** concept is the user-friendly mounting and flashing system. The panel fixings remain hidden underneath the surface flashing. The standing seams of a building will now blend in much better with the rest of the facade. With the **Delign** flashing system, a facade can have continuous parallel horizontal lines, which can carry on around the building's corners.

No more obvious, pillar-like standing seams. Paroc® Delign breaks the bars holding back the creativity of building designers!
